LAKEBASE-DOTNET-DEVOPS · WHAT EACH GIT EVENT TRIGGERS

App + database DevOps on Lakebase

One box per environment. Inside each, top to bottom: the Git event, the GitHub Actions workflow it fires, and what changes in Lakebase — first the PR, then the merge.

databricks

FEATURE branch

1 `push feature/*`

Branch from `develop`, add `V{n}__*.sql`

WORKFLOW

- **Nothing runs** — No workflow listens to feature pushes. Optional: dispatch `github-branch.yml` by hand for a Dev test branch.

LAKEBASE Dev environment

No change. Manual dispatch or local CLI can create `feature-<name>` in the Dev project.

DEVELOP branch

2 `pull_request → develop`

Open or update the PR

WORKFLOW

- **`pr-branch.yml`** — Build, unit tests, SQL lint. No secrets. required check
- **`pr-lakebase.yml`** — If Flyway files changed: create `pr-N`, migrate, validate. On PR close: delete it.

LAKEBASE Dev environment

`pr-N`

Isolated copy of Dev stable, 24h TTL. Your SQL is applied here first.

THEN

3 `push: develop`

Merge the PR into `develop`

WORKFLOW

- **`dev-promote.yml`** — Promote to Dev. Snapshot → migrate → read-only, at the merge SHA.

LAKEBASE Dev environment

`pre-migrate-…` `production`

Snapshot stable (48h), then replay Flyway on Dev stable.

RELEASE branch

4 `pull_request → staging`

Open PR `develop → staging`

WORKFLOW

- **`pr-branch.yml`** — Build, unit tests, SQL lint. No secrets. required check

LAKEBASE Test environment

No change.

THEN

5 `push: staging`

Merge into `staging`

WORKFLOW

- **`staging-promote.yml`** — Promote to Staging. Fails fast unless the PR head was `develop`.

LAKEBASE Test environment

`pre-migrate-…` `production`

Snapshot stable (48h), then replay the same SQL on Staging stable.

MAIN

6 `pull_request → main`

Open PR `staging → main`

WORKFLOW

- **`pr-branch.yml`** — Build, unit tests, SQL lint. No secrets. required check

LAKEBASE Production environment

No change.

THEN

7 `push: main`

Merge into `main`

WORKFLOW

- **`production-promote.yml`** — Promote to Production with `rehearse_on_cow: true`. Snapshot → migrate a throwaway copy → migrate stable only if that passed. PR head must be `staging`.

LAKEBASE Production environment

`pre-migrate-…` `rehearse-…` `production`

Snapshot stable (48h). Migrate + validate on `rehearse-…` (24h). Pass → replay on Production stable and delete the rehearsal. Fail → stable untouched, rehearsal kept for inspection.
